

Time for action

Sunday Times, South Africa 8 OCT 07

Comment

When I read the United Nations's new report on the state of the planet over the weekend, my mind kept snagging on a handful of figures. There were some bright spots — lead has been removed from petrol almost everywhere and sulphur emissions have been reduced in most rich nations — and plenty of gloom. But the issue that stopped me was production.

Crop production has improved over the past 20 years (from 1,8 tonnes per hectare in the 1980s to 2,5 tonnes today), but it has not kept up with population. "World cereal production per person peaked in the 1980s, and has since slowly decreased". There will be roughly nine billion people by 2050: feeding them and meeting the Millennium Development Goal on hunger [halving the proportion of hungry people] would require a doubling

of world food production. Unless we cut waste, overeating, biofuels and the consumption of meat, total demand for cereal crops could rise to three times the current level.

There are two limiting factors. One, mentioned only in passing in the report, is phosphate: it is not clear where future reserves might lie. The more immediate problem is water. "Meeting the Millennium Development Goal on hunger will require doubling of water use by crops by 2050." Where will it come from? "Water scarcity is already acute in many regions, and farming already takes the lion's share of water withdrawn from streams and groundwater." Ten per cent of the world's major rivers no longer reach the sea all year round.

Buried on page 148, I found this statement. "If present trends continue, 1,8-billion people will be living in countries or regions with absolute water scarcity by 2025, and two-thirds of the world population could be subject to water stress." Waste and deforestation are partly to blame, but the biggest cause of the coming droughts is climate change. Rainfall will decline most in the

places in greatest need of water. So how, unless we engineer a sudden decline in carbon emissions, are we going to feed the world? How, in many countries, will we prevent the social collapse that failure will cause?

The stone drops into the pond and a second later the pond is smooth again. You will turn the page and carry on with your life. Last week we learned that climate change could eliminate half the world's species; that 25 primate species are already slipping into extinction; that biological repositories of carbon are beginning to release it, decades ahead of schedule. But everyone is watching and waiting for everyone else to move. The unspoken universal thought is this: "If it were really so serious, surely someone would do something?"

To prevent runaway climate change, we must cut the greater part possibly almost all — of the world's current emissions. Before long we will have to buy our credits from Mars and Jupiter. The only certain means of preventing runaway climate change is to cut emissions here and now.

Who will persuade us to act?

Rapid rise in Chinese babies born with defects

Cape Times South Africa 31 OCT 07

BEIJING: The number of babies with birth defects in China has increased by nearly 40% since 2001, according to data from the country's birth deformity monitoring centre, the China Daily reported yesterday.

"A baby with defects is born every 30 seconds in China and this situation has worsened year by year," said Jiang Fan, deputy head of the National Population and Family Planning Commission, at a conference in Chengdu, in south-west

China's Sichuan province.

Birth deformities affect up to 6% of all children born in China, or nearly one in every 10 Chinese households.

The rate of defects among all Chinese infants rose from 104.9 per 10 000 births in 2001 to 145.5 in 2006. Jiang said of the 20 million babies born in China every year, 800 000 to 1.2 million of them are afflicted with defects, with as many as 300 000 of these "visible deformities".

According to the statistics reported, only 20 to 30% of the

babies can be cured or treated, about 40% suffer lifelong deformities, while the remaining 30 to 40% die shortly after birth.

Jiang said the deformities generate costs of several hundreds of billion yuan.

Experts say there is enough evidence to correlate the high occurrence of birth defects to geographic, environmental and economic factors and noted that the coal-producing province of Shanxi now tops the nation in birth defect rates.

15 DEC 07.

Dear Wayne: Many thanks for your letter of 8 DEC 07 & the additional enclosures, which are both informative & useful. I shall pass them onto others.

I recently heard on the jewsmedia that ZOG is developing its own anti-gravity technology, so you may be disappointed to arrive on Mars, only to find a greeting committee of polywogs & nig-nogs, who might kindly enquire: "What took you so long, Mon?" A jovial jew might shout: "Hey, Goyim, join the crowd!" I just hope such a scenario remains in the realm of nightmare, rather than reality.

I would not be too prone to forecast political events with great certainty, nor, for that matter, would I project demographic events in terms of the present. Assuredly, I'd be surprised to see a great diminution in the Asian & Eurasian populations. I don't pretend to know the future with great exactitude, beyond my projections of immediate events, into the near future, which I can see developing. What would surprise me most of all would be a sudden show of intelligence on the part of Whites, but I shall not hold my breath in anticipation thereof. In all of history, Whites have never displayed any brilliance when it came to White Survival. We love to tinker under the hood, while we let hostile aliens into the driver's seat. We make the aliens' car go faster, & we are foolish enough to believe that we have accomplished something worthwhile, by giving the aliens the vehicle with which to run us over, much faster. Such a deal!

The supposition that Whites may land on Mars first is, as you indicate, unlikely. ZOG may send some Whites & non-Whites to Mars as guinea pigs. ZOG will give the Chinese its technology as did Bernie Schwartz of Loral, in respect of our latest missile guidance systems, which allowed China to shoot down one of its space satellites, pronto. So, even if Whites, per se, were to land on Mars, it is likely that they'd welcome the non-White colonists on board, so the race-mixing could proceed, as on Earth.

My Scottish grannie used to impart her gritty wisdom in her sayings. One of them was "What comes easily is not appreciated." If a people knew how hard their ancestors had to struggle to establish vestiges of civilization in The New World, would they be so quick to give their civilization to alien invaders? Whites certainly do! By giving away the fruits of the past, we also give away our future. We would do just the same anywhere we were to land.

The hippies knew one thing which was true & relevant: Our battle must be waged, first, in Inner Space, rather than Outer Space. Otherwise we are merely spreading our dysfunctional incompetence to other New Worlds, as we did here on Earth. Mankind needs to evolve from its mistakes here on Earth. Why should we transplant our Mistake-Makers to other planets, so the same mistakes may be repeated? I trust Nature, not man, to make survival decisions, since we have shown ourselves to be incapable thereof. Man has the dinosaurs to remind us that we are expendable. As I see it, we are creatures of The Universe, so our extinction will indicate that The Universe has no further use for us. We exist on Nature's bounty & sufferance much more than we do on our brainpower. As one writer observed: "Man has never avoided disasters; he merely survives them," at least, some do.

As you say, we certainly need young leaders, so where are they? Unfortunately, the Ostensible White leaders I have encountered reside in the gulags of ZOG. I've met no potential leaders on the Outside who seem to be on Our Side. That does not mean they're not around, but that they haven't been found, except by ZOG. ZOG's job is to find White leaders, whom ZOG will seek to co-opt, incarcerate &/or kill. I got on ZOG's list in elementary school, as did a son of our local preacher. Both of us questioned the basis of "Student Government," which lacked sovereignty. My services to ZOG were limited, since I did not crave its rewards, nor did I much fear its punishments. To quote jewspeak usage: I must be 'uniquer' than most. Ha! Unfortunately, potential leaders in ZOG-gulags may not have Internet access. My advice is, don't be downhearted, & keep up the good work, on behalf of getting Whites to THINK. Yes, I'm asking you to perform a miracle. ORION!
